## 大致步骤

- 安装wsl2
- 修改windows可选功能
- 安装ubuntu22.04发行版
- 在ubuntu系统中配置环境

## 安装wsl2

这个没什么好说的, wsl --install 就行

## 安装ubuntu

不爱折腾的同学直接去微软软件商店下一个ubuntu22.04就行

此时打开ubuntu22.04.exe可能会报错,给你一个0x8037之类的错误码,这大概率是因为你没有修改下面这些选项

X

请勾选适用于linux的windows子系统 以及 虚拟机平台

# 在ubuntu系统中配置环境

### 换源

因为某些原因,建议大家先换个源,不然你大概率下不了依赖库

sudo chmod 777 /etc/apt/sources.list

这里建议大家换中科大的源

进入网站 https://mirrors.ustc.edu.cn/repogen/

选择和你的ubuntu版本一致的源,ubuntu22.04的话直接就是下面这一堆

deb https://mirrors.ustc.edu.cn/ubuntu/ jammy main restricted universe multiverse
deb-src https://mirrors.ustc.edu.cn/ubuntu/ jammy main restricted universe multiverse

deb https://mirrors.ustc.edu.cn/ubuntu/ jammy-security main restricted universe multiv€ deb-src https://mirrors.ustc.edu.cn/ubuntu/ jammy-security main restricted universe mul

deb https://mirrors.ustc.edu.cn/ubuntu/ jammy-updates main restricted universe multiver deb-src https://mirrors.ustc.edu.cn/ubuntu/ jammy-updates main restricted universe mult

deb https://mirrors.ustc.edu.cn/ubuntu/ jammy-backports main restricted universe multiv deb-src https://mirrors.ustc.edu.cn/ubuntu/ jammy-backports main restricted universe multiverse mul

## Not recommended

# deb https://mirrors.ustc.edu.cn/ubuntu/ jammy-proposed main restricted universe multi # deb-src https://mirrors.ustc.edu.cn/ubuntu/ jammy-proposed main restricted universe m

首先我们把原来的源删干净

echo > /etc/apt/sources.list

然后 sudo vim /etc/apt/sources.list

按i进入插入模式,把这一堆复制进去,因为你用的是wsl2不是原生ubuntu,直接ctrl-v就能复制

然后按一下esc键,再按一下:wq 保存,你要是实在不会用vim,你可以直接 echo 你复制的这些源 >> /etc/apt/sources.list

### 加个DNS

sudo vim /etc/resolv.conf

加一行 nameserver 8.8.8.8

你在vim中按o可以向下添加一行,大O可以向上添加一行,自动进入插入模式,复制完后 esc :wq 保存即可

8.8.8.8可以让你享受google的域名解析服务

### 配环境

sudo apt-get install build-essential

linux世界最重要的开发工具包,如果报错请先 sudo apt-get update ,如果 update 本身报错请看看自己时间是不是不对,因为中科大的源是东八区的,要是你时间不对肯定不行,时间不对的话直接在 windows 里面改就 ok

### 时间不对的话,报错大致如下

```
Do you want to continue? [Y/n] y
Get:1 /home/owenramber1989/cc0-debian.deb cc0 amd64 20220712 [4161 kB]
Ign:2 http://archive.ubuntu.com/ubuntu jammy-updates/main amd64 linux-libc-dev amd64 5.15.0-52.58

```

#### 然后用我之前发的install.sh即可

```
wget https://c0.cs.cmu.edu/downloads/cc0-debian.deb
sudo apt install ./cc0-debian.deb
cc0 -h
```

#### 然后验证一下cc0和coin是否都可用了

```
owenramber1989@Owenraml ×
owenramber1989@Owenramber1989:~$ cc0
CO reference compiler (ccO) version 20220712 (built Tue 12 Jul 2022 02:34:00 PM EDT)
Usage: cc0 [OPTION...] SOURCEFILE
where OPTION is
               --verbose
                                   Give verbose status and error messages
               --help
                                   Give short usage message and exit
  -h
 -d
               --dyn-check
                                    Check contracts dynamically
               --no-purity-check
                                   Disable checking contract functions for purity
               --library=<lib>
 -l <lib>
                                   Include the library <lib>
  -L <dir>
                                    Add <dir> to the search path for libraries
                                    Pass an argument to the executing CO program
 -a <arg>
                                   Force language std. (ie c0), ignoring extension
               --standard=<std>
 -V
                                   Print version number and compile info
               --version
                                   Disable logging for this compile
               --no-log
  -n
 -W[warning]
                                   Enable warning/warning group
               --dump-ast
                                   Pretty print the program's abstract syntax tree
                                   Save .c and .h files produced by the compiler
               --save-files
  -s
                                   Select a runtime (default 'c0rt')
 -\mathbf{r}
    <rt>
               --runtime=<rt>
                                   Generate bytecode instead of executable
 -b
               --bytecode
 -m <arch>
               --bc-arch=<arch>
                                    Set bytecode architecture: 64 (default) or 32
 -o <file>
               --output=<file>
                                   Place the executable output into <file>
                                   Pass an argument to the C compiler
Warn about style issues in the code
  -c <arg>
  -w
               --warn
                                    Execute compiled file
 -x
               --exec
                                   Stop after typechecking
               --only-typecheck
Extended usage:
cc0 -g <file> [-o <obj_file>]
                                    Compile <file> to an object file
 cc0 -i <obj_file>
                                    Display the interface of <obj_file>
cc0 [OPTION...] SOURCEFILES
                                    SOURCEFILES can include object files
```

```
-i <obj_file> has alternate syntax --interface=<obj_file>
wenramber1989@Owenramber1989:~$ coin
0 interpreter (coin) 1.0.0 'Quarter' (v20220712, Tue 12 Jul 2022 02:34:00 PM EDT)
ype `#help' for help or `#quit' to exit.
-> #help
oin - the CO interpreter.
seing in the Coin interpreter is like being inside of a CO function. You
an declare and assign to variables (for instance, by typing 'int x=5;'
and then `x++;' or `x /= 2;') and you can see the value of variables and
xpressions (for instance, by typing `true || false;').
lemember: every statement or expression must end with a semicolon `;'.
he following special "pragmas" allow you to pass commands to Coin.
                  List all available functionsDisplay this message
 #functions
 #help
                  - Display the contents of all declared local variables
 #locals
                  - List the fields of all available structs
 #structs
 #quit
                  - Exit the interpreter
 #reload
                  - Reload libraries and files; clear local variables
```

#### 这样就ok了
